

Goals

We plan to connect users through a social feature. This will incorporate a chat feature, a list of contacts/groups for members, a polling feature by which to vote on a dining location, and an events option where users can create their own events and join others. In addition to these, individuals will also be able to see their friends' names and emails, as well as the group's mood for any given event. As far as debugging is concerned, the Spice team hopes to raise a number of issues and resolve these on the github repository, besides including more Junit unit tests in their final sprint and any additional error checking. In terms of the UI, the desire is to create a more robust design, with more progress meters, splash and loading pages, a sleeker design, and more interfaces. With regard to the app's functionality, the team also intends to incorporate routes for a given dining destination that may be displayed in Google Maps, more refined searches, push notifications for unanswered polls with groups, more functionality for the Home page, and to clean up the source code overall.
